Supported languages: Description: A familiar concept in this day and age, compression is the process of turning audio data into a smaller amount of data. The point is to change the size of the audio data in such a way that it can be stored in a smaller space, which has practical applications. Compression can be as straightforward as encoding sound, but it can also be so subtle and complicated that it becomes almost impossible to tell who was the one who made the decision. Understanding compression is crucial, but even if you're not that much into sound recording, the concept can still be applied. We often hear audio compression while listening to streaming music or other online content, where files are sent to us via internet. Chances are that the compression applied in this case is one of the reasons we have to deal with buffering, where audio files have to be sent piece by piece as they're needed. Ok I hate to be that person. I have been putting off looking at this for awhile because I didn't think it was worth the time. I have a very limited computer, and I prefer using computers for songs rather than audio files as they sound better. While I was searching for something that I could use to normalize a file that I had, I found this. I think I'm going to make my laptop mp3 so that I can have a more portable app for this. I will make a note of the app so I can refer back to it in the future. I have been using Adobe Audition, but I don't think it does this very well. The problem is that I have tons of WAV files I need to normalize, and there is no way to track down the original sound for all of them. My solution to this would be for me to download this and normalize my music files. A look at iTunes says that it has a feature to normalize WAV files. I have updated iTunes to the latest version and I can't find anything in it to normalize WAV files. I'm very surprised there is no way to do this since I've been using Apple's program for years to normalize audio files from my computer, which is useless. I am hoping that I can get audio normalization done with this. If not, it's the next best thing, so I have my priorities in order! What are your thoughts on this? Sources
