AutoCAD 2018 is the seventh edition of the program and introduced many significant features, including the ability to simultaneously work on several projects using a single user interface and interact with other systems like the Microsoft Windows operating system, Amazon Alexa or Google Home. The 2018 release is also the first release since the company's acquisition by French enterprise software company, Atos in May 2016. AutoCAD 2018 is a full-featured, application-based drafting program designed for both professional drafters and home users. The 2018 release is an upgrade to AutoCAD 2017 and includes several new features and functional enhancements, including an improved surface modeling feature and 3D drawing tools. What Is AutoCAD? AutoCAD is a fully featured CAD application for computer-based drafting, design and editing. The product was originally developed and sold by Autodesk, a provider of digital design software for architects, interior designers, engineers, contractors, and other professionals. The software can be used for a variety of purposes including for architectural, engineering and construction management applications, interior design and mechanical drafting. Unlike most other CAD programs, AutoCAD is not a drawing creation application and does not allow the user to create individual drawings using a mouse and input devices like a mouse, keyboard, or stylus. This is where other 2D drawing applications, like Microsoft PowerPoint, come in handy. Instead, AutoCAD is an application that specializes in a variety of industry-specific areas, including: architectural and construction drafting, mechanical design, landscaping and 3D modeling. It was the first commercially available application to fully integrate 3D modeling and other design-related tools. The Everest, currently on display at the Frankfurt Motor Show, features a 'mushroom' shaped nose. In a press release, Tata Motors said that it is in a 'completely new category' and is aimed at those who 'don't like the shape and feel of a typical SUV.' This decision is, of course, in the very nature of what makes the brand Tata Motors. For a company that has built cars that are based on space frames, this bold step into the SUV segment is pretty surprising. However, Tata Motors knows its customers and has rightly concluded that the Everest will appeal to a much larger audience of people than the Swift and the Indica. In fact, the Everest seems to be a purely marketing exercise, which is likely to be followed by a price-tag of a little more than a million pounds (\$1.5 million). This isn't the first time that Tata Motors has delved into the SUV market. The brand previously launched the Tiago based on the Daewoo Matiz, but was quickly sold off to Mahindra. More recently, the company has brought out two compact SUVs called the Nexon, and the Tiago that's based on the Tata Nano. With the Tiago, the Everest might seem like a confused mix between the Nexon and the Tiago. It also recalls the Avensis, a car which was launched over 15 years ago. The Everest, therefore, seems to be the family-oriented SUV version of the Nexon and the Tiago.Q: 'Bad return code' error in 'python foo.py | wc -l'?
